

PROJECT GOAL

The RISC-V Scalar Cryptography Extension is a set of instructions that can accelerate cryptographic operations on RISC-V processors. Our project provides a secure and efficient way to implement cryptographic algorithms on RISC-V processors. Improves the performance of cryptographic operations such as accelerating the encryption and decryption of data, which is useful for applications such as secure boot and secure communication.

SCALAR CRYPTO RISC -V EXTENSION

**SECURE YOUR DATA
WITH THE POWER OF
RISC -V**

PROJECT EXPLAIN

Our objective is to strengthen the RISC-V architecture by incorporating the Advanced Encryption Standard cryptographic algorithm as an extension. As an open-source instruction set architecture, RISC-V's flexibility allows us to introduce specialized AES instructions that enable efficient encryption and decryption of individual data blocks.

This enhances its appeal for applications requiring robust data security, such as communication, finance, and sensitive information handling. This implementation showcases it as an attractive platform for secure data encryption in various industries, ultimately contributing to a more secure computing ecosystem.

OUR MISSION

To develop a standard RISC-V instruction set extension that improves the performance of cryptographic operations

OUR VISION

Enable a more secure and efficient future for embedded systems and the Internet of Things.

WHY CHOOSE US?

STANDARDIZATION

Standardize the implementation which improves the security

PORTABILITY

A valuable tool for developers developing cryptographic applications

IMPROVE SECURITY

Improve security by providing an efficient way to implement algorithms
